

ABSTRACT

Brush, intended to apply a powdered product, includes a typically rigid mount and an element for applying the product integral with the mount including a typically flexible application material, characterised in that:

- 5 a) the mount acts as a support to at least two different application elements, typically two different tufts of the application material, each application element or different tuft including a foot or base B_i so as to anchor each application element to the mount, and a sheaf
10 including or constituted by the flexible application material, each sheaf emerging from a different portion of the mount M along a different surface S_i of said mount,
- b) the brush forms a typically two-dimensional object, with the larger dimension typically less than 50 mm, in such
15 a way that the brush is able to be placed in a make-up case.
